

A bespoke system for a trusted organisation at a national level

Client vision:

With a large number of properties and building users, the Royal Mail approached 4see with the challenge of creating a system to validate all asbestos information across their portfolio. The system needed to be compliant with the current legislation and the company's internal procedures, as well as being available to all building users.

How 4see helped:

It was imperative that the system included all aspects of survey work, re-inspections and remediation works. We therefore developed an approach that sees all of the information from the various parties undertaking asbestos related work channelled to a single point within 4see. From this point it is then assurance checked by

highly qualified professionals to ensure it is of the required standard. Once verified, the information is added to a live Asbestos Management Database (AMD) which can be accessed remotely by Royal Mail personnel, and authorised suppliers and contractors when required. Hard copies of management plans are delivered to site to ensure current information is available on premises in the site log book where all personal can view it even if they do not have access to the AMD.

4see very quickly understood our needs and for a complex organisation that was extremely helpful as this meant that we could move at pace and provide a solution to a difficult problem.

Andi Whittle, Compliance & Assurance Manager, Royal Mail
